## CHLORTROL

...Chlorine and pH Feeder

The CHLORTROL is more than just a feeder system - it is complete peace of mind when it comes to water treatment. It is knowing that your water is correctly maintained so family and friends are not at risk from infection.

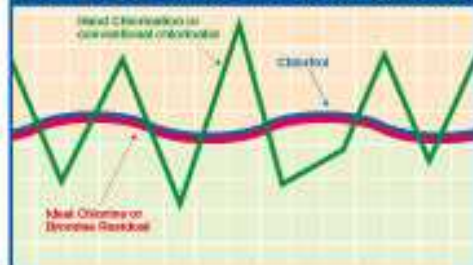

The CHLORTROL is designed so you can adjust your pool chemical levels while the pump/filter is operating. To operate efficiently, you must run the pump/filter sufficiently to ensure good mixing of the water. This varies due to the differing size and shape of pools, but normally 4-5 hours per day is adequate.

Like all superior devices, the CHLORTROL must be installed correctly to obtain the best results, so please ask your dealer to explain the installation process if unsure.

### Electrical Supply

The CHLORTROL unit requires a supply voltage of 220/250VAC AND MUST be connected to the pump operating circuit so that it will only operate ONLY when the pump/filter is running.

### Keeping your chemicals consistent means less waste and better hygiene.
