Cell gas - no flow issue **Cartridge Filter Pools**

Cell gas - no flow error:

This is an important safety feature as a build-up of chlorine gas can be dangerous. This is not a warranty issue - it is a water flow issue.

The display above left shows the Cell being turned OFF after chlorine gas is detected for approximately 10 seconds. If gas is still detected after approximately 2 minutes the pump will also be turned OFF – and the display will read as shown above right.

To re-start the pump, simply press the ON-button (as instructed by the display). This will reset the warnings and allow the pump to run (for a maximum of 3 minutes if gas is still detected).

Important troubleshooting:

If your system will not run for more than 2 minutes, try the following to test whether your cartridge in your filter is causing the issue.

- Remove cartridge from filter, replace lid of filter into position.
- Turn on system and run for a few minutes. If the system does not shut down due to cell gas, then your cartridge either needs a good clean or replacing as it is blocking the water flow, causing a gas build up in the cell housing.

To test the pump is fully operational.

Plug the pump GPO directly into wall power point to bypass the chlorinator.

This will test the pumps functionality.

Please leave in for at least 5 minutes to allow the pump to change to Low speed (if applicable)
